Debugging dead TOF channels

How to check for dead channels?

The `liftof-tui` program (installed on gse machines under `$HOME/tof-moni`) and called with `./liftof-tui` can display waveforms in the terminal. To do the TOF checkout, the TOF has to be set to trigger on the *ANY* trigger, which means each paddle triggers independently.

A dataset of at least 30 mins should be saved to disk.

- The suggested procedure is a guideline and might need to be adapted depending on the situation
- The most likely issue to occur seem to be a power connector issue which might be resolved by reseating power connectors
- Please consult with Field about switching RATs on/off.
